Security

IndieAuth is part of the IndieWeb movement to take back control of your online identity. Instead of logging in to websites as "you on Twitter"; or "you on Facebook", you should be able to log in as just "you". We should not be relying on SILOs to provide our authenticated identities, we should be able to use our own domain names to log in to sites everywhere.

It works by linking your website to one or more authentication providers such as Twitter or GitHub, then entering your domain name in the login form on websites that support IndieAuth. You can also host your own token endpoint.

IndieAuth is a way to use your own domain name to sign in to websites.

Add links on your home page to your external social profiles with the attribute [rel="me"].

Ensure your external profiles link back to your home page.
