Control

Security

IndieAuth is part of the IndieWeb movement to take back control of your online identity. Instead of logging in to websites as "you on Twitter" or "you on Facebook", you should be able to log in as just "you".
Host your own token endpoint.

RelMeAuth works by linking your website to one or more authentication providers such as Twitter or GitHub.
Add [rel="me"] links and ensure your external profiles link back.

indielogin.com is an implementation which let's you use it in a breath.

IndieAuth is a way to use your own domain name to sign in to other websites.

RelMeAuth is a way to use social providers with your own domain name proving your identity.
